

# Technical Architecture – Siffrum Platform

## 1. Technology Stack

The proposed system will be built using a modern full-stack architecture that supports scalability, security, and AI integration.

Frontend technologies:

- HTML5
- CSS3
- JavaScript
- React.js / Next.js

Key functions include loan dashboards, user data input forms, financial analytics graphs, and repayment strategy visualization.

## 2. Programming Language

Frontend: JavaScript

Backend: Python

Python is selected because of its strong ecosystem for machine learning, fast API development capability, and robust fintech/data analysis libraries.

Framework options include FastAPI and Django REST Framework.

## 3. Backend Workflow

The backend follows a client-server model where the frontend communicates with backend services using secure APIs.

Workflow:

1. User logs into the platform
2. User enters loan information
3. Frontend sends API request
4. Backend processes and validates data
5. Data is stored in database
6. Machine learning models analyze repayment risk
7. System generates recommendations and stress scores
8. Results are returned to the user dashboard

## 4. API Structure

Authentication APIs  
POST /api/register  
POST /api/login  
GET /api/user-profile

Loan Management APIs  
POST /api/add-loan  
GET /api/get-loans  
PUT /api/update-loan  
DELETE /api/delete-loan

Analytics APIs  
GET /api/stress-score  
GET /api/loan-summary  
GET /api/repayment-plan

Simulation APIs  
POST /api/simulate-snowball  
POST /api/simulate-avalanche  
POST /api/simulate-refinance

## 5. Database Design

Recommended Databases:

- PostgreSQL for structured financial data
- MongoDB for behavioral logs and analytics

Core tables:

Users Table

user\_id, name, email, password\_hash, monthly\_income, employment\_type, created\_at

Loans Table

loan\_id, user\_id, principal\_amount, interest\_rate, tenure\_months, emi\_amount, start\_date, loan\_status

Transactions Table

transaction\_id, user\_id, loan\_id, transaction\_amount, category, date

Stress Analysis Table

analysis\_id, user\_id, stress\_score, default\_probability, recommended\_strategy, created\_at

## 6. System Architecture Overview

The architecture consists of five major layers:

- User Interface Layer
- API Gateway Layer
- Application Logic Layer
- Machine Learning Engine
- Data Storage Layer

This layered architecture ensures modular development, scalability, and secure data processing.
